Magnetic separation takes advantage of the fact that magnetite is strongly magnetic (ferromagnetic), hematite is weakly magnetic (paramagnetic), and most gangue minerals are not magnetic (diamagnetic). A simple magnetic separation circuit can be seen in Figure 1.2.5 [9].A slurry passes by a magnetized drum; the magnetic material sticks to the drum, while the nonmagnetic slurry keeps flowing.

For spinel ferrite with cubic structure, the lattice constant (a) and the unit-cell volume (V<sub>uc</sub>) of the NPs are calculated using the following equations: (4)  $a = d \sqrt{h^2 + k^2 + l^2}$  (5)  $V_{uc} = a^3$  where (hkl) are the Miller indices associated with the diffraction peaks and d is the interplanar distance obtained from the X-ray diffraction pattern. The average crystallite size of the ...

3.1 Phagocytosis. Phagocytosis occurs primarily in professional phagocytes (e.g., macrophages, monocytes, neutrophils, and dendritic cells), which are responsible for host defense and the uptake of dead cells and cell debris.However, some other types of cells (e.g., fibroblasts, epithelial, and endothelial cells) also have phagocytic activity, but to a lower extent and are referred to as para ...
